AMENDMENT TO THE SPECIFICATION

Page 13, first full paragraph:

The mitral shield may be constructed of biological material (e.g., human or bovine pericardium) or non-biological material (e.g., Dacron, PTFE, a biocompatible plastic, a biocompatible metal such as titanium, nitinol wire, etc). It may also consist of autologous cells grown on a matrix or frame. The sheet may be attached to the annulus using sutures, staples, wire, medical grade adhesives or other means of fixation. Thus, for example, in Fig. \pm \pm staples 15 are shown attaching shield 5 to the annulus of the valve.
